 La fonction wait() permet d'attendre l'execution d'un process en donnant son id en paramtres avant d'executer le reste du code

```
int id;
id = fork();

wait(0); //id 0
//child
if (id == 0)
{
         printf("nike\n")
}
//parent
else
{
         printf("zeubi\n")
}
```

```
>>>
"nike"
"zeubi"
```
